Current Paradigm for Early Universe Cosmology

Inflation

Brandenberger

Introduction

Perturbations

Observational
Challenges for
Inflation

Theoretical
Challenges for
Inflation

Conclusions

The **Inflationary Universe Scenario** is the current paradigm of early universe cosmology.

Successes:

- Solves **horizon problem**
- Solves **flatness problem**
- Solves **size/entropy problem**
- Provides a causal mechanism of generating **primordial cosmological perturbations** (Chibisov & Mukhanov, 1981).

Conclusions

1970arXiv:1704.04488v1[astro-ph]

Fig. 1a. Diagram of gravitational instability in the "big-bang" model. The region of instability is located to the right of the line $M_J(t)$; the region of stability to the left. The two additional lines of the graph demonstrate the temporal evolution of density perturbations of matter: growth until the moment when the considered mass is smaller than the Jeans mass and oscillations thereafter. It is apparent that at the moment of recombination perturbations corresponding to different masses correspond to different phases.

Fig. 1b. The dependence of the square of the amplitude of density perturbations of matter on scale. The fine line designates the usually assumed dependence $(\delta\rho/\rho) \sim M^{-2}$. It is apparent that fluctuations of relic radiation should depend on scale in a similar manner.

R. Sunyaev & Ya. Zeldovich, *Astrophysics and Space Science* 7

3-19 (1970)

Key Realization

R. Sunyaev and Y. Zel'dovich, *Astrophys. and Space Science* **7**, 3 (1970); P. Peebles and J. Yu, *Ap. J.* **162**, 815 (1970).

Inflation

Theoretical
Challenges for
Inflation

Conclusions

- Given a **scale-invariant power spectrum of adiabatic fluctuations** on "super-horizon" scales before t_{eq} , i.e. standing waves.
- → "correct" power spectrum of galaxies.
- → **acoustic oscillations in CMB angular power spectrum.**
- → **baryon acoustic oscillations in matter power spectrum.**
- Inflation is the first scenario based on causal physics which yields such a spectrum.
- But it is not the only one.

Quantum Theory of Linearized Fluctuations

V. Mukhanov, H. Feldman and R.B., *Phys. Rep.* 215:203 (1992)

Inflation

Brandenberger

Introduction

Perturbations

Observational
Challenges for
Inflation

Theoretical
Challenges for
Inflation

Conclusions

Step 1: Metric including fluctuations

$$ds^2 = a(t)^2[(1 + 2\Phi(\mathbf{x}, t))d\eta^2 - (1 - 2\Phi(\mathbf{x}, t))d\mathbf{x}^2]$$
$$\varphi = \varphi_0(t) + \delta\varphi(\mathbf{x}, t)$$

Note: Φ and $\delta\varphi$ related by Einstein constraint equations

Step 2: Expand the action for matter and gravity to second order about the cosmological background:

$$S^{(2)} = \frac{1}{2} \int d^4x ((v')^2 - v_{,i}v^{,i} + \frac{z''}{z}v^2)$$

$$v = a(\delta\varphi + \frac{z}{a}\Phi)$$

$$z = a\frac{\varphi_0'}{\mathcal{H}}$$

Quantum Theory of Linearized Fluctuations

Conclusions

Step 1: Metric including fluctuations

$$ds^2 = a(t)^2[(1 + 2\Phi(\mathbf{x}, t))d\eta^2 - (1 - 2\Phi(\mathbf{x}, t))d\mathbf{x}^2]$$

$$\varphi = \varphi_0(t) + \delta\varphi(\mathbf{x}, t)$$

Note: Φ and $\delta\varphi$ related by Einstein constraint equations

Step 2: Expand the action for matter and gravity to second order about the cosmological background:

$$S^{(2)} = \frac{1}{2} \int d^4x ((v')^2 - v_{,i}v^{,i} + \frac{z''}{z}v^2)$$

$$v = a(\delta\varphi + \frac{z}{a}\Phi)$$

$$z = a\frac{\varphi_0'}{\mathcal{H}}$$

Step 3: Resulting equation of motion (Fourier space)

$$v_k'' + \left(k^2 - \frac{z''}{z}\right)v_k = 0$$

Features:

- **oscillations** on sub-Hubble scales
- **squeezing** on super-Hubble scales $v_k \sim z$

Quantum vacuum initial conditions:

$$v_k(\eta_i) = (\sqrt{2k})^{-1}$$

Connection with curvature perturbation in comoving gauge:

$$\zeta = z^{-1}v \tag{1}$$

Step 3: Resulting equation of motion (Fourier space)

$$v_k'' + \left(k^2 - \frac{z''}{z}\right)v_k = 0$$

Features:

- **oscillations** on sub-Hubble scales
- **squeezing** on super-Hubble scales $v_k \sim z$

Quantum vacuum initial conditions:

$$v_k(\eta_i) = (\sqrt{2k})^{-1}$$

Connection with curvature perturbation in comoving gauge:

$$\zeta = z^{-1}v \tag{1}$$

Step 3: Resulting equation of motion (Fourier space)

$$v_k'' + \left(k^2 - \frac{z''}{z}\right)v_k = 0$$

Features:

- **oscillations** on sub-Hubble scales
- **squeezing** on super-Hubble scales $v_k \sim z$

Quantum vacuum initial conditions:

$$v_k(\eta_i) = (\sqrt{2k})^{-1}$$

Connection with curvature perturbation in comoving gauge:

$$\zeta = z^{-1}v \quad (1)$$

Step 3: Resulting equation of motion (Fourier space)

$$v_k'' + \left(k^2 - \frac{z''}{z}\right)v_k = 0$$

Features:

- **oscillations** on sub-Hubble scales
- **squeezing** on super-Hubble scales $v_k \sim z$

Quantum vacuum initial conditions:

$$v_k(\eta_i) = (\sqrt{2k})^{-1}$$

Connection with curvature perturbation in comoving gauge:

$$\zeta = z^{-1}v \tag{1}$$

Gravitational Waves

Inflation

Brandenberger

Introduction

Perturbations

Observational
Challenges for
Inflation

Theoretical
Challenges for
Inflation

Conclusions

$$ds^2 = a^2 [(1 + 2\Phi)d\eta^2 - [(1 - 2\Phi)\delta_{ij} + h_{ij}]dx^i dx^j]$$

- $h_{ij}(\mathbf{x}, t)$ transverse and traceless
- Two polarization states

$$h_{ij}(\mathbf{x}, t) = \sum_{a=1}^2 h_a(\mathbf{x}, t) \epsilon_{ij}^a$$

- At linear level each polarization mode evolves independently.

Gravitational Waves II

Inflation

Brandenberger

Introduction

Perturbations

Observational
Challenges for
Inflation

Theoretical
Challenges for
Inflation

Conclusions

Canonical variable for gravitational waves:

$$u(\mathbf{x}, t) = a(t)h(\mathbf{x}, t)$$

Equation of motion for gravitational waves:

$$u_k'' + \left(k^2 - \frac{\ddot{a}}{a}\right)u_k = 0.$$

Squeezing on super-Hubble scales, **oscillations** on sub-Hubble scales.

Consequences for Tensor to Scalar Ratio r

Inflation

Brandenberger

Introduction

Perturbations

Observational
Challenges for
Inflation

Theoretical
Challenges for
Inflation

Conclusions

Assuming adiabatic fluctuations:

- If EoS of matter is time independent, then $z \propto a$ and $u \propto v$.
- In this case $r \sim 1$.
- During a phase transition EoS changes and u evolves differently than v (z evolves differently than a).
- \rightarrow Suppression of r .
- Example 1: Inflationary reheating transition.
- Example 2: nonsingular bounce phase in a bouncing cosmology.

Inflation

Theoretical
Challenges for
Inflation

Conclusions

- The initial vacuum spectrum is blue:

$$P_{\zeta}(k) = k^3 |\zeta(k)|^2 \sim k^2$$

- The curvature fluctuations grow on super-Hubble scales in the contracting phase:

$$v_k(\eta) = c_1 \eta^2 + c_2 \eta^{-1},$$

- For modes which exit the Hubble radius in the **matter phase** the resulting spectrum is scale-invariant:

$$\begin{aligned} P_{\zeta}(k, \eta) &\sim k^3 |v_k(\eta)|^2 a^{-2}(\eta) \\ &\sim k^3 |v_k(\eta_H(k))|^2 \left(\frac{\eta_H(k)}{\eta}\right)^2 \sim k^{3-1-2} \\ &\sim \text{const}, \end{aligned}$$

Spectrum of Gravitational Waves

Inflation

Inflation

Conclusions

If we project the resulting shape function \mathcal{A} onto some popular shape masks we get

$$|\mathcal{B}|_{NL}^{\text{local}} = -\frac{35}{8},$$

for the **local shape** ($k_1 \ll k_2 = k_3$). This is negative and of order $O(1)$.

For the **equilateral form** ($k_1 = k_2 = k_3$) the result is

$$|\mathcal{B}|_{NL}^{\text{equil}} = -\frac{255}{64},$$

For the **folded form** ($k_1 = 2k_2 = 2k_3$) one obtains the value

$$|\mathcal{B}|_{NL}^{\text{folded}} = -\frac{9}{4}.$$

Conclusions

Idea: make use of the **new symmetries** and **new degrees of freedom** which string theory provides to construct a new theory of the very early universe.

Assumption: Matter is a gas of fundamental strings

Assumption: Space is compact, e.g. a torus.

Key points:

- **New degrees of freedom**: string oscillatory modes
- Leads to a **maximal temperature** for a gas of strings, the Hagedorn temperature
- **New degrees of freedom**: string winding modes
- Leads to a **new symmetry**: physics at large R is equivalent to physics at small R

T-Duality

Perturbations

Observational
Challenges for
Inflation

Theoretical
Challenges for
Inflation

Conclusions

T-Duality

- Momentum modes: $E_n = n/R$
- Winding modes: $E_m = mR$
- Duality: $R \rightarrow 1/R$ $(n, m) \rightarrow (m, n)$
- Mass spectrum of string states unchanged
- Symmetry of vertex operators
- Symmetry at non-perturbative level \rightarrow existence of D-branes

Method

Inflation

Brandenberger

Introduction

Perturbations

Observational
Challenges for
Inflation

Theoretical
Challenges for
Inflation

Conclusions

- Calculate matter correlation functions in the Hagedorn phase (neglecting the metric fluctuations)
- For fixed k , convert the matter fluctuations to metric fluctuations at Hubble radius crossing $t = t_i(k)$
- Evolve the metric fluctuations for $t > t_i(k)$ using the usual theory of cosmological perturbations

Extracting the Metric Fluctuations

Inflation

Brandenberger

Introduction

Perturbations

Observational
Challenges for
Inflation

Theoretical
Challenges for
Inflation

Conclusions

Ansatz for the metric including cosmological perturbations and gravitational waves:

$$ds^2 = a^2(\eta) \left((1 + 2\Phi) d\eta^2 - [(1 - 2\Phi)\delta_{ij} + h_{ij}] dx^i dx^j \right).$$

Inserting into the perturbed Einstein equations yields

$$\langle |\Phi(k)|^2 \rangle = 16\pi^2 G^2 k^{-4} \langle \delta T^0_0(k) \delta T^0_0(k) \rangle,$$

$$\langle |h(k)|^2 \rangle = 16\pi^2 G^2 k^{-4} \langle \delta T^i_j(k) \delta T^i_j(k) \rangle.$$

Challenges for
Inflation

Conclusions

Key ingredient: For **thermal fluctuations**:

$$\langle \delta\rho^2 \rangle = \frac{T^2}{R^6} C_V.$$

Key ingredient: For **string thermodynamics** in a compact space

$$C_V \approx 2 \frac{R^2 / \ell_s^3}{T(1 - T/T_H)}.$$

Power spectrum of cosmological fluctuations

$$\begin{aligned} P_{\Phi}(k) &= 8G^2 k^{-1} \langle |\delta\rho(k)|^2 \rangle \\ &= 8G^2 k^2 \langle (\delta M)^2 \rangle_R \\ &= 8G^2 k^{-4} \langle (\delta\rho)^2 \rangle_R \\ &= 8G^2 \frac{T}{\ell_s^3} \frac{1}{1 - T/T_H} \end{aligned}$$

Key features:

- **scale-invariant** like for inflation
- **slight red tilt** like for inflation

Power spectrum of cosmological fluctuations

$$\begin{aligned}
 P_{\Phi}(k) &= 8G^2 k^{-1} \langle |\delta\rho(k)|^2 \rangle \\
 &= 8G^2 k^2 \langle (\delta M)^2 \rangle_R \\
 &= 8G^2 k^{-4} \langle (\delta\rho)^2 \rangle_R \\
 &= 8G^2 \frac{T}{\ell_s^3} \frac{1}{1 - T/T_H}
 \end{aligned}$$

Key features:

- **scale-invariant** like for inflation
- **slight red tilt** like for inflation

Tilt of the Tensor Mode Spectrum

Inflation

Brandenberger

Introduction

Perturbations

Observational
Challenges for
Inflation

Theoretical
Challenges for
Inflation

Conclusions

- Inflationary cosmology (with matter obeying the energy conditions) yields a **red tilt of the tensor spectrum**.
- Measuring a blue tilt would **falsify** inflation.
- Measuring a red tilt would mean that inflation passes a further consistency check.
- Inflationary consistency relation: $n_t = -r/8$
- String gas consistency relation: $n_t \simeq +(1 - n_s)$.
